

REPLACEMENT SHEET

Abstract of the Disclosure

A method for producing whey powder from whey concentrate. After primary crystallization, the whey is dried to a moisture content of at least 9% to produce a powder with reduced stickiness during drying, resulting from further crystallization being carried out quickly and completely. The end product is non-caking. A device for drying the whey treats the discharged drying gases in order to make the whey particles less sticky so that a filter can be used rather than a cyclone.
